Down but not out

Rigosertib did not meet its primary endpoint of overall survival (OS) in the Phase III ONTIME trial in higher-risk myelodysplastic syndromes (MDS), but showed a statistically significant OS improvement in the subgroup of patients who had progressed or failed on hypomethylating agents (HMAs). The news is a setback, but there remains a path forward for rigosertib in a substantial subpopulation of higher-risk MDS in our opinion. We have reduced our valuation to \$303m or \$14.1/basic share by lowering rigosertib sales estimates and the probability of success in higher-risk MDS.

Year end	Revenue (\$m)	PBT* (\$m)	EPS* (\$)	DPS (\$)	P/E (x)	Yield (%)
12/11	1.5	(27.6)	(14.8)	0.0	N/A	N/A
12/12	46.2	(30.3)	(15.5)	0.0	N/A	N/A
12/13e	3.3	(68.5)	(8.9)	0.0	N/A	N/A
12/14e	0.0	(77.4)	(3.6)	0.0	N/A	N/A

Note: *PBT and EPS are normalised, excluding intangible amortisation, exceptional items and share-based payments.

ONTIME missed its primary endpoint...

The ONTIME Phase III trial compared rigosertib IV to best supportive care (BSC) in higher-risk MDS patients who had progressed, failed or relapsed after previous HMA therapy. Although there was a numerical advantage favouring rigosertib (median OS was 8.2 months vs 5.8 months for control) and a hazard ratio (HR) of 0.86, this did not achieve the p<0.05 level of statistical significance (p=0.27). Rigosertib performed as expected (the Phase III design assumed a median OS of c 35 weeks, or 8.16 months), but the BSC arm exceeded expectations (assumed median OS of 17-22 weeks, or 3.96-5.13 months).

...but showed efficacy in a post hoc subgroup

However, a post hoc analysis of efficacy in subgroups found rigosertib to be efficacious in patients who progressed or failed previous treatment with HMAs. The median OS was 8.5 vs 4.7 months, HR of 0.67 and p-value of 0.022. The subgroup was not predefined, but nevertheless represents a substantial proportion (184 of 299, or 61.5%) of patients in the study. It is also clinically distinct (all patients are HMA non-responders) and the most challenging to treat (HMA failures have the poorest prognosis), and therefore has the greatest clinical need. For these reasons, we consider rigosertib could be further developed for this patient group, pending a dialogue with the FDA in the near future.

Valuation: Reduced to \$303m

We have reduced our valuation to \$303m by lowering the rigosertib sales estimates (peak sales \$305m, down from previously \$625m in higher-risk MDS) and the assumed probability of clinical success rate to 50% (from 65%). Given the share price reaction to the news, this suggests there is still upside to the shares if development of rigosertib for higher-risk, HMA non-responder MDS patients can be continued.

Business description

Onconova Therapeutics is a clinical-stage biopharmaceutical company focused on developing novel small molecule drug candidates to treat cancer. Its lead drug candidate, rigosertib, is partnered with Baxter (Europe) and SymBio (Japan/Korea) and is in a Phase III trial for higherrisk MDS (IV form), and in Phase II for lower-risk MDS (oral form).

Update: ONTIME miss, but efficacy in HMA subgroup

The ONTIME Phase III study of rigosertib in higher-risk myelodysplastic syndromes (MDS) failed to show a statistically significant improvement in overall survival (OS), but a post hoc analysis did show a statistically significant OS improvement in the subgroup of patients who had progressed or failed on hypomethylating agents (HMAs). The news is a setback for Onconova, but there remains a path forward for rigosertib in a substantial subpopulation of higher-risk MDS in our opinion.

The ONTIME trial compared rigosertib IV to best supportive care (BSC) in higher-risk MDS patients who had progressed, failed or relapsed after previous HMA therapy. Although there was a numerical advantage favouring rigosertib (median OS was 8.2 months vs 5.8 months for control) and a hazard ratio (HR) of 0.86, this was not sufficient to reach the p<0.05 level of statistical significance (p=0.27). Rigosertib performed as expected (the Phase III design assumed a median OS of c 35 weeks, or 8.16 months), but there was a better than expected survival in the BSC arm (assumed median OS of 17-22 weeks, or 3.96-5.13 months).

However, a post hoc analysis of efficacy by subgroups suggests rigosertib may be efficacious in patients who progressed on or failed previous treatment with HMAs. There were 184 patients in this group (61.5%, 127 in the treatment arm and 57 on BSC) and the median OS was 8.5 months vs 4.7 months, equivalent to an HR of 0.67, achieving a p-value of 0.022. The subgroup was not predefined in the statistical analysis plan, but does represent a substantial proportion of second-line, higher-risk MDS patients. It is also clinically distinct (all patients are HMA non-responders) and is the most challenging to treat (HMA failures have the poorest prognosis), and therefore has the greatest clinical need. For these reasons, we believe that rigosertib could be further developed for this subtype, pending a dialogue with the FDA in the near future.

The other subset, comprising patients who had relapsed after responding to previous treatment with HMAs (115 of 299 enrolled), did not show a survival benefit. Additional analysis is underway to identify potential survival benefit in other subsets of patients.

Preliminary safety analysis indicates that rigosertib was generally well tolerated in the study. Severe adverse events were uncommon, with a similar profile of serious adverse events in both study arms. Grade 3/4 treatment-related hematologic and non-hematologic adverse events were reported in less than 7% and 3% of patients, respectively. Incidence of all grades of treatment-related nausea, diarrhoea, fatigue and constipation were 22%, 17%, 17% and 15%, respectively. All other treatment-related adverse events were reported in less than 10% of patients.

Onconova intends to present additional details, including secondary endpoints, at the 2014 ASCO Annual Meeting.

Sensitivities

The near-term investment case now rests on rigosertib's fate in higher-risk MDS, following the ONTIME trial result. A positive outcome from a pending meeting with the FDA, which may open the way for further development in HMA non-responders, would be positive and serve as a major catalyst for the stock. The longer-term investment case now rests on the ability to develop oral rigosertib for lower-risk MDS, with a decision on the Phase III pivotal programme possible in 2014. Given the disappointment of ONTIME, continuing support from partners Baxter and SymBio, which we expect to be the case, will be crucial. Onconova is currently well financed with sufficient cash to last into 2015, but may need to raise additional funds to support operations beyond 2015, particularly if new trials in higher-risk MDS patients are to be started.

Valuation

We have updated our valuation of Onconova in the light of the ONTIME study. The valuation remains based on a DCF model that examines revenues, possible milestone payments and royalties over rigosertib's lifecycle (from approval to patent expiry in 2026-27) based on forecast sales in second-line, higher-risk HMA non-responders (previously all high-risk, second-line MDS) and first-line, lower-risk MDS, with assumed probabilities of 50% (previously 65%) and 35% applied to these indications. Peak sales for rigorsertib IV for second-line, high-risk MDS has been reduced to \$305m, based on HMA failures only, compared to a previous forecast of \$625m, which had assumed all patient subtypes. This approach yields an intrinsic value of \$272m for the pipeline. Adding forecast year-end 2014 cash of \$30.5m yields a total value is \$303m, equivalent to \$14.1 per basic share (\$13.5 per diluted share). Previously, we had valued Onconova at \$476m, or \$22.3 per basic share (\$20.7 per diluted share).

Total number of shares (m)								24.2
Diluted value per share								\$13.5

Financials

We have updated our financial model to eliminate a \$50m milestone payment (\$100m expected, but 50% risk-adjusted) in 2014 that would have been receivable from partners on a positive ONTIME result. Onconova has guided to ending 2013 with of \$98m of cash (our model suggests \$99m) and as we continue to estimate cash utilisation of c \$68m in 2014, we expect Onconova to end the year with cash of c \$31m. We expect the company to provide new financial guidance at its 2013 year-end financial conference call and will update our model accordingly.
